JET FUEL MANAGEMENT™

FUEL SOLUTIONS FOR LOGISTICS & TRANSPORT

Airlines • Airports • Marine • Mining • Rail • Road

Jet Fuel Management (JFM)™ is a new strategic alliance from established firms in fuel management – **AirTrav Inc.** in Canada and **Jet-A, Inc.** in the U.S. Together, we provide global fuel management expertise for **aviation**, **marine**, **rail** and **road** logistics operators, **mining** firms and **pipeline** operators, covering infrastructure, forecasting and pricing, risk management, procurement, supply chain optimization, compliance, tax recovery, and other areas.

JFM optimizes costs and assures supply for fuel-intensive operators, establishing end-to-end perspectives based on a clear infrastructure master planning, operational requirements, market pricing, and supply-demand drivers that impact pricing. In aviation, JFM supports extends from refinery to the wing of the aircraft or logistic carrier.

We leverage strong industry relationships and maintain knowledge of market conditions to mitigate cost exposure for clients on both sides of the fuel equation: Optimizing supply, distribution facilities and infrastructure for companies providing fuelling services; while stabilizing costs through operational efficiency, risk management, supply chain synergies, and lower procurement costs for companies providing transport services.

Capable, results focused delivery

JFM has a proven track record in the delivery of complex fuel services that are characterized by their quality and value-add insights. Our delivery process ensures that functional and technical requirements are defined and documented, and that projects once implemented are properly planned, scheduled, and controlled.

JFM expertise is of advantage to:

Airlines that are impacted by fuel price risk, differential costs (storage, thruput, into-wing), consumption rates, carbon programs (credits, regulatory, taxes, cap and trade, offset) quality, availability, and environmental issues. We also work with airport consortia and fuel farm operators, assisting with pricing, supply, distribution and storage solutions.

Airports and Fixed Base Operators which require supply availability assurance and competitive pricing, infrastructure investment, new or upgraded fuelling systems, equipment, or procedures as part of initiatives to satisfy changing fuel management requirements and regulations, or to address performance issues with existing systems.

Governments, Logistics Companies, Marine Operators, Militaries, Mining Firms, and NGOs that require technical and supply chain expertise to support fuel-related projects including infrastructure, deployments and operational efficiency.

Midstream and Downstream support for pipeline operators, refined fuel and additive manufacturers or distributors, including refineries, oil companies and fuel suppliers wanting to extend their own programs to improve fuel usage.
